

RhinoClean™

PRODUCT DATA SHEET

HR2800™ Haze Remover

Description

- Specially formulated thick liquid to remove imbedded U.V., conventional and plastisol inks (haze / ghost images) that remain on the screen following emulsion removal
- HR2800™ effectively lifts the haze and imbedded ink from the mesh then emulsifies and dissolves the ink constituents; resins, binders, pigments, plasticizers, etc.
- The solution suspends these constituents so reattachment to the mesh surface is prohibited, thus allowing for water-rinse removal
- Excellent degreaser, as it also removes dirt and residue

Directions

1. Apply HR2800™ directly to both sides of the screen starting from center and working to the sides in a circular fashion.
2. Let stand approx. 10 minutes.
3. To eliminate image, remove coating with a high pressure cleaner starting from the bottom of screen and working to top moving in a side to side motion.

It is the responsibility of the screen printer to test the product; review the MSDS prior to use to evaluate whether or not the product is correct for the application intended.
